Lever System with Fulcrum Point

Product Image

Description

Components: Rigid Steel Arm: A level, solid arm made of steel, designed to resist bending and deformation under force. Fulcrum (Pivot Point): The point or axis where the lever rotates. It is a fixed support that allows the arm to pivot when force is applied. Applied Force: The force exerted on one side of the lever. This force can lift or move a load on the other side, depending on the length of the arm and the position of the fulcrum. Weight (Load): The object or weight that is being moved or lifted by the lever system.
